Description of the degree program

Data Science (Master)
PO 2

Date: 23.09.2024

Table of contents

ECTS	120

Ramp Up Phase	
ECTS	10

Title	Ramp up Course Mathematics		
Number	1294580	**Module version**	V2
Shorttext		**Language**	
Frequency of offer	every term	**Teaching unit**	Carl-Friedrich-Gauß-Fakultät
Module duration	1 Semester	**Institution**	
Hours per Week / ECTS	6 / 10,0	**Module owner**	
Workload (h)			
Class attendance (h)	72	**Self studying (h)**	228
Compulsory requirements			
Recommended requirements			
Expected performance/ Type of examination	1 ungraded examination (Prüfungsleistung): 1 written exam (120 minutes) according to examiner's specifications. After approval by the examination board mathematics (Prüfungsausschuss Mathematik), the examiner can also choose the take-home exam as the form of examination. The exact examination specifications will be announced at the beginning of the course.		
Course achievement			
Module grade composition			

Contents

- Introduction to Data Science (2 weeks) - jointly with RampUp Computer Science
- Algebra (2 weeks)
- Numerics (2 weeks)
- Discrete mathematics (2 weeks)
- Analysis (2 weeks)
- Stochastics (2 weeks)
- Continuous optimization (2 weeks)

Objective qualification

The students
- know understand the underlying concepts of mathematics that are necessary for data science
- understand the concepts of analysis, algebra, optimization, discrete mathematics, stochastics and numerics and are able apply them in the context of data science

Literature

- Mathematics for machine learning, Deisenroth, Faisal, Ong, Cambridge University Press, available at https://mml-book.com/

- Networks, Crowds, and Markets: Reasoning about a Highly Connected World, Easley, Kleinberg, Cambridhe University Press, availale at https://www.cs.cornell.edu/home/kleinber/networks-book/networks-book.pdf

Contents

- Introduction to Data Science (2 weeks) - jointly with RampUp Mathematics
- Software engineering (Schulze, 4 weeks)
- Database management (Balke, 4 weeks)
- Security and privacy (Rieck, 2 weeks)
- Distributed systems (N.N., 2 weeks)

Objective qualification

After successful completion of this module, students have a basic understanding of the underlying concepts of computer science that are necessary for data science. They are able to
- design and develop software systems for data analysis
- understand and implement distributed analysis processes
- apply and operate modern database systems
- evaluate and protect the security and privacy of data

Further, students have a general overview of the methods of data science and the application areas. They know the general principles and processes of data science projects.

Methods and concepts of Computer Science	
ECTS	25

Title	Pattern Recognition		
Number	2424690	**Module version**	
Shorttext	ET-NT-69	**Language**	english german
Frequency of offer	every term	**Teaching unit**	Fakultät für Elektrotechnik, Informationstechnik, Physik
Module duration	1	**Institution**	
Hours per Week / ECTS	4 / 5,0	**Module owner**	Tim Fingscheidt
Workload (h)	150		
Class attendance (h)	56	**Self studying (h)**	94
Compulsory requirements			
Recommended requirements			
Expected performance/ Type of examination	Oral exam 30 min. or written exam 90 min.		
Course achievement			
Module grade composition			

Contents

- Bayesian decision rule
- Quality metrics in pattern recognition
- Supervised learning with parametric distributions
- Supervised learning with non-parametric distributions, classification
- Linear discriminant functions, single-layer perceptron
- Support vector machines (SVMs)
- Multi-layer perceptron, neural networks (NNs)
- Deep learning
- Unsupervised learning, clustering methods

Note: For pattern recognition using hidden Markov models (HMMs), a separate more in-depth module, Spoken Language Processing (ET-NT-68), is offered in the summer semester.

Objective qualification

Upon completion of this module, students gain fundamental knowledge about methods and algorithms for classification of data. They are capable to select the appropriate means for real-world problems, to design a solution and to evaluate it.

Literature

- R.O. Duda, P.E. Hart, D.G. Stork: Pattern Classification, Wiley, 2001
- C.M. Bishop: Pattern Recognition and Machine Learning, Springer, 2006

Remark

Basic knowledge of statistics, such as acquired in the module "Probability Theory and Statistics", facilitates the understanding of the lecture.

Course achievement	50% of the exercises must be passed		
Module grade composition			

Contents

This module will give a broad overview over all methods and approaches that are necessary for reasoning over large knowledge bases using first order predicate logics. Moreover, the architecture of the Semantic Web is investigated with the a special focus on Semantic Web standards, modeling languages, ontologies and ontology languages, and advanced Semantic Web techniques. In particular,
- Logic programming, predicate logic as a data model
- Top-down and bottom-up strategies for query processing
- Datalog and processing recursive Datalog queries
- Query optimization with Magic Sets
- Knowledge representation
- Object-oriented extension, path queries
- Recursion in databases, Common Table Expressions
- User-Defined Types and User-Defined Functions
- Semantic Web standards (RDF, OWL, etc.)
- Semantic Web architecture and techniques

Objective qualification

On completion of this module, students are aware of the challenges and problems which arise from reasoning processes over large knowledge bases. This covers technical aspects (algorithms,implementations, etc.) and also methodological aspects (e.g. uncertainty, etc.). Furthermore, the students will be able to discuss the strengths and weaknesses of different approaches to reasoning and will be able to competently propose solution strategies to practical problem scenarios.

Contents

This module will give a broad overview over all methods that are necessary for building and using data warehouses in large-scale applications. Besides typical techniques for warehouse design, indexing, and online analytical processing (OLAP), also advanced data mining techniques, such as classification, clustering, frequent item set mining, and association rules are covered in the lecture. In paticular,
- Statistical methods in databases
- Knowledge discovery and mining of local structures
- Frequent Item Set Mining and Association Rules
- Hierarchical and partitioning clustering algorithms
- (Linear) classification and support vector machines
- Architecture of data warehouses (ROLAP, MOLAP,...)
- Multi-dimensional data models (star, snowflake)
- Extraction, data transformation and cleaning
- Techniques for online analytical processing (OLAP)
- Storage- and Index structures for data warehouses

Objective qualification

Data warehousing and mining the data within warehouses represent an important basis for corporate decision support. Students understand possible data warehouse architectures and their essential processes and know the details of the major data mining algorithms used, to be able to correctly and meaningfully underpin decisions with data. They are enabled to critically analyze and evaluate the respective application of various algorithms.

Recommended requirements			
Expected performance/ Type of examination	1 written exam (90 minutes) or oral exam (30 minutes) or Take-at-Home-Exam		
Course achievement	50% of the exercises must be passed		
Module grade composition			

Contents

The module gives an introduction to Web Information Retrieval with particular emphasis on the algorithms and technologies used in the modern search engines. It covers an introduction to traditional text IR, including Boolean retrieval, vector space model as well as tolerant retrieval. Afterwards, the technical basics of Web IR are discussed, starting with a Web size estimation and duplicate detection followed by link analysis and crawling. This leads on to the study of the modern search engine evaluation methods and various test collections. Finally, applications of classification and clustering in the IR domain are discussed. During the module the theoretical basis is illustrated by examples of modern search systems, such as Google, Bing, Yahoo!, etc. In particular,
- Structured vs. unstructured data
- Text retrieval, probabilistic, fuzzy- and vector space models
- Assessment of retrieval quality, precision-recall analysis
- Architecture of Web information systems and search engines
- Structure of the WWW, Web crawling and indexing
- Document clustering and ontologies for search
- Text and link metrics, Page-Rank, HITS, etc.

Objective qualification

Information retrieval techniques play a central role not only in Web search engines, but in all kinds of document-centric applications. Students need to understand different techniques, their typical application areas and limitations, as well as their advantages and disadvantages. They are enabled to choose the right techniques for the respective practical problem and to critically reflect their use in the respective application context.

Module grade composition			

Contents

Fundamental principles and theories of machine learning und the underlying mathematical and statistical methods are introduced and learning problems are formalized. Important fundamental terminology, concepts and methods are treated, in particular for regression, among those are
- model selection, machine learning bias vs. parameter optimization
- training, test and validation
- generalization, overfitting, regularization
- linear regression, generalized linear models
- non-linear models, neural networks
- classification
- estimatimation, unbiased minimal variance estimators
- concept learning, decision trees, random forests
- methods of lazy learning
- unsupervised learning
- Gaussian mixtures, Gaussian mixture regression
- Unified Regression Model

Objective qualification

With successful completion of the module, the students possess the following knowledge and capabilities. They are able to
- understand and correctly apply basic concepts of machine learning
- analyse and formalize a machine learning problem
- distinguish between typical machine learning methods
- select a suitable method for a learning problem
- compare and judge machine learning methods wrt their capacity
- implement machine learning methods and apply them practically
apply and parametrise respective tools
- judge strength and weaknesses of machine learning in applications
- recognize ethical issues in the application of machine learning

Contents

- History of visualizaton
- Visualization form an information-theoretic perspective
- Aspects of visual perception theory
- visualization and cognition
- Information visualization techniques
- Interactivity in visualization

Objective qualification

This course offers an overview of computer graphics visualization. It conveys the psychological foundations of visual information perception and provides insight into their algorithmic implementation as basis for various visualization techniques. Graduates of this course will be familiar with relevant aspects of visual perception and cognition theory as well as algorithmic concepts of
visualization.

Contents

- Introduction to Python
- Introduction to explorative data analysis in Python
- Statistical data analysis
- Unsupervised machine learning
- Supervised machine learning
- Critical assessment of machine learning

Objective qualification

After successful completion of this module, students will have the competence to apply Python for designing and implementing small to medium software projects and analytic workflows with a focus on statistics and machine learning. During an interactive learning phase during which the students will be able to apply common packages such as scikit-learn, and they will be able to
synthesize analysis workflows for diverse data science questions. These workflows will be presented and discussed in a mini-conference among the students. After the mini-conference, students will form small teams to develop data science software tools which will be presented during the closing event. They will gain the competence to critically evaluate machine learning workflows.

Contents

• Geometric problems and data structures
• Convex hulls
- Closest pairs
- Voronoi diagrams
- Point triangulation
- Polygon triangulation
- Tour problems
- Other advanced research topics

Objective qualification

Participants know basic modeling for geometric algorithms.
They can gauge the algorithmic difficulty of geometric problems and
formulate appropriate objectives. They can master different solution techniques
and are capable of developing algorithmic methods for new problems.
They understand the practical relevance of problems and solutions.

Hours per Week / ECTS	4 / 5,0	**Module owner**	Sandor Fekete
Workload (h)	150		
Class attendance (h)	56	**Self studying (h)**	94
Compulsory requirements			
Recommended requirements			
Expected performance/ Type of examination	graded work: written exam (120 minutes) or oral exam (30 minutes) minutes) or Take-Home-Exam. The form of the examination depends on the number of participants and will be announced at the beginnung of the lecture.		
Course achievement	non-graded work: 50% of the exercises must be passed		
Module grade composition			

Contents

- A basic introduction to NP-completeness and approximation
- Approximation for vertex and set cover
- Packing problems
- Tour problems and variations
- Current research problems

In the context of various problems, a wide spectrum of techniques and concepts will be provided.

Objective qualification

Participants know the necessity and role of approximation algorithms. They can master the most important techniques for analysis and complexity of approximation algorithms for designing, including the validity of upper and lower bounds.

Literature

- Vijay V. Vazirani: Approximation Algorithms. 1st edition. Springer Verlag, 2001.

- Dorit Hochbau: Approximation Algorithms for NP-hard Problems. Course Technology Inc, 1996.

Contents

The cousre content has a mandatory relation to topics of data science. The concrete course content in the seminar depends on the subject area worked on and may vary each semester.

Objective qualification

- The students are able to independently familiarize themselves with a scientific Topic.
- They are able to prepare the topic and present it in an oral presentation.
- The students are able to use adequate presentation technique and rhetorical skills.

Contents

This module covers the software development process of high-performance computing (HPC) applications (CFD simulations) and its efficient automatization in Linux environments. The following aspects are included:

1. Introduction on Unix and Linux systems in the context of HPC systems
2. Fundamental shell commands and advanced Unix tools
3. Get to know shell-based editors
4. Automatization with shell scripts
5. Introduction on the C++ programming language (compiling, testing, debugging)
6. Tools for version control and automatization of distributed software development#
7. Introduction to parallel computing

Objective qualification

Attending the course, the students will be able to:

- Understand and use the fundamentals of the Linux-operating system and basic Unix tools
- Automate HPC workflows using Shell-scripts
- Write, compile and debug programs in C++
- Automate the steps of compiling, testing and executing
- To structure the development process of program code using software

Literature

Recommended requirements	Basic knowledge of logic (in particular propositional logic) and software engineering (in particular process models, UML class diagrams, design patterns) as well as programming experience (e.g., in Java) are required.		
Expected performance/ Type of examination	1 graded work: Written exam+ (90 minutes) or oral exam+ (20 minutes)		
Course achievement	1 non-graded work: Solve exercises relevant to the lecture		
Module grade composition			

Contents

Modern software often must be available on many platforms and adapted to many different user and customer needs. This applies to system software (e.g., operating systems), application software (e.g., word processing and games) and complex cyber-physical systems (e.g., automobiles). The resulting variety of configurations poses challenges for the development, testing, and maintenance of such systems. The course teaches, among other things, how the configurability of systems can be modeled, which implementation techniques allow extensible and configurable software to be developed, and which strategies can still be used for meaningful testing despite an exponential number of variants.

The course includes the following contents:
- Introduction to software variability and inherent challenges
- Modeling and analysis of the desired variability
- Implementing variability at runtime (e.g., configuration options) and at compile time (e.g., clone-and-own)
- Implementation of software product lines:
  - Implementing features using conditional compilation (e.g., preprocessors and build systems).
  - Modular implementation of features (e.g., components, services and plug-ins)
  - Limitations of object orientation and extensions of object orientation (e.g. feature modules, aspects)
  - Design patterns for software variability
- Process models for the use and development of software product lines
- Problems and dealing with feature interactions
- Methods for static and dynamic quality assurance of software product lines
- Current topics from research and practice

Objective qualification

Students are able to
- identify the limitations of traditional programming techniques regarding the development of variable software.
- describe modeling, analysis and configuration of variability in software product lines.
- apply different implementation techniques for the development of software product lines.
- evaluate the suitability of presented programming techniques for different development scenarios.
- explain quality assurance techniques for software product lines and the associated challenges.

Literature
• Feature-Oriented Software Product Lines - Concepts and Implementation; Sven Apel, Don Batory, Christian Kästner, Gunter Saake; Springer, 2013 • Mastering Software Variability with FeatureIDE; Jens Meinicke, Thomas Thu#m, Reimar Schröter, Fabian Benduhn, Thomas Leich, Gunter Saake; Springer, 2017

Expected performance/ Type of examination	graded examination (Prüfungsleistung): 1 written exam (90 minutes) or 1 oral exam (20-30 minutes) according to examiner's specifications. After approval by the examination board mathematics (Prüfungsausschuss Mathematik), the examiner can also choose the take-home exam as the form of examination. The exact examination specifications will be announced at the beginning of the course.		
Course achievement	Non-graded coursework (Studienleistung): Homework according to examiner's specifications. The exact examination specifications will be announced at the beginning of the course.		
Module grade composition			

Contents

- Fundamentals from mathematics and physics for quantum computers
- Computational model for quantum computers
- Central algorithms for the quantum computer model
- Relation to complexity

Objective qualification

The students
- understand the of the complex links between their previous mathematical knowledge and the contents of the lecture
- understand the theoretical body of the lecture as a whole and master the corresponding methods
- are able to analyze and apply the methods of the lecture

- master the fundamentals to understand the model of a quantum computer
- know the algorithmic applications of this model
- know and understand the quantum computer model in light of the theory complexity

Contents

- Modeling dynamic processes via ODE and DAE
- Theory of the initial value problem for ordinary differential equations (ODE) and differential algebraic (DAE) equations
- Marginal value problem, solution via single and multi shooting methods
- Modeling and transformation of optimal control problems
- The Bellmann principal
- Direct, indirect, sequential and simultaneous approaches, including e.g. Pontryagin's Maximum Principal, Single Shot method, collokation methods, multi shooting methods, dynamic optimization, the Hamilton-Jacobi-Bellman-Equality
- Structures and their use in direct multi shooting methods
- Parameter estimation and dynamic problems
- The generalized Gauß-Newton-method, local contraction und convergence
- Statistics of the generalized Gauß-Newton-method
- Optimal experimental design
- Model discrimination

Objective qualification

The students
- understand the of the complex links between their previous mathematical knowledge and the contents of the lecture
- understand the theoretical body of the lecture as a whole and master the corresponding methods
- are able to analyze and apply the methods of the lecture

- know and understand the problems of optimal control, parameter estimation, optimal experimental design and model discrimination
- know and understand the different fundamental approaches in the field of optimal control are are able to apply and analyze them

- are able to analyze, interpret, refine and enhance the methods, especially to increase the efficiency of numerical algorithms exemplified for optimal control

Recommended requirements			
Expected performance/ Type of examination	graded examination (Prüfungsleistung): 1 written exam (90 minutes) or 1 oral exam (20-30 minutes) according to examiner's specifications. After approval by the examination board mathematics (Prüfungsausschuss Mathematik), the examiner can also choose the take-home exam as the form of examination. The exact examination specifications will be announced at the beginning of the course.		
Course achievement	Non-graded coursework (Studienleistung): Homework according to examiner's specifications. The exact examination specifications will be announced at the beginning of the course.		
Module grade composition			

Contents

- Linear and Nonlinear Regression
- Matrix Completion
- Low Rank Parameterization
- Nonnegative Matrix Factorisation
- Sparse Inverse Covariance
- Sparse Principal Component Analysis
- Nichtlineare Support Vector Machines
- Logistic Regression
- Deep Learning
- selected applications

Objective qualification

The students
- understand the of the complex links between their previous mathematical knowledge and the contents of the lecture
- understand the theoretical body of the lecture as a whole and master the corresponding methods
- are able to analyze and apply the methods of the lecture

- remember and understand exemplary problems in Data Science
- master selected problem solving abilities using methods of continuous optimization and are able to apply them
- understand theory and algorithms of continuous optimization in the context of statistical phenomena of the data basis

Contents

Students learn basic concepts and tools from numerical linear algebra that are used in data mining. After the course, students should be able to solve problems in data mining on their own using the methods discussed in the course.

Ideas and algorithms from numerical linear algebra are important in several areas of data mining. This course gives an introduction on the information extraction from data by means of concepts and tools from numerical linear algebra. The following topics are covered in the course: low-rank-approximation of matrices, methods for least-squares-problems, the singular value decomposition, nonnegative matrix factorizations, eigenvalue algorithms.

Objective qualification

The students
- understand the of the complex links between their previous mathematical knowledge and the contents of the lecture
- understand the theoretical body of the lecture as a whole and master the corresponding methods
- are able to analyze and apply the methods of the lecture

- know and understand the methods of linear algebra in the context of data mining
- are able to anaylze and evaluate problems in this field and to develop methods for their solution on the basis of the content of the lecture

Advanced Computerlab Numerical Analysis

The advanced numerics computing lab deals with advanced methods of scientific computing. We will discuss high-level application problems stemming from mathematics in finance, industry or data science. For numerically solving these problems, various numerical methods will be employed most of which have already been presented in courses such as „Numerische Methoden in der Finanzmathematik“, „Numerical Linear Algebra“, „Numerik gewöhnlicher Differenzialgleichungen“ or „Numerical Methods and Learning from Data“. These methods have to be implemented efficiently, if necessary, in parallel and they should be verified for practical examples. In doing so, the possibilities of these methods as well as their limits will be seen. For some demanding numerical subtasks well-established numerical software libraries exist which have proven to be very efficient in many cases. These can be migrated with the students‘ own implementations and one can waive the development of hand-written codes.

Advanced Computerlab Optimization
The goal is to combine advanced knowledge in mathematical optimization with practical planing and realization of large-scale optimization problems. To this end algorithms to solve complex mathematical models of mathematical optimization, partly known from the lectures "discrete optimization", „continuos optimization" or various advanced courses in mathematical optimization, shall be implemented and tested. Thereby, the possibilities and limits will be explored. A sufficiently wide sub-field of optimization may serve as general theme, e.g.
- Algorithms for scheduling, knapsack, coloring or routing problems.
- Algorithms for differentiable or non-smooth non-linear optimization problems with or without constraints.

As well-tested and highly efficient methods are available for central methods, it is important to be able to use such software (e.g. CPLEX, Gurobi, Matlab) for pertaining applications.

Advanced Computerlab Data Science
In the Advanced Computerlab Data Science, current machine learning models are implemented, trained, applied and interpreted in order to work on practical questions on the basis of extensive structured or unstructured data sets. Fundamentals and techniques imparted on a theoretical level (e.g. models and their evaluation, optimization algorithms, interpretation techniques) are applied and expanded in practice by means of functions provided in various frameworks

(e.g. TensorFlow, Keras, Matplotlib). The independent implementation of machine learning models in Python forms a further focus in addition to the use of specialized frameworks.

Advanced Computerlab Statistical Learning
The focus of the Advanced Computerlab Statistical Learning is on well-known machine learning methods. These are mainly considered from the perspective of mathematical statistics. For presented structured and unstructured data, students are taught how to find suitable solutions, how to implement them, e.g. in the statistical software R, and how to interpret the results. Advantages and disadvantages of the methods used as well as the underlying model assumptions are discussed from a probabilistic or statistical point of view. Students have the opportunity to apply their knowledge of probability theory and mathematical statistics acquired in previous courses. One focus of the course is the independent implementation of machine learning models using frameworks such as TensorFlow, mlr3, Keras, among others.

Objective qualification
The students - remember and understand the basic tasks and method of mathematicl algorithms and their praktical appliastion - are able to use mathematical programming tools - are able to apply, analyze and implement mathematical algorithms - are able to document and present mathematical algorithms

Class attendance (h)	84	**Self studying (h)**	216
Compulsory requirements			
Recommended requirements	Mathematical knowledge in 'Probability and Statistics' is required.		
Expected performance/ Type of examination	graded examination (Prüfungsleistung): 1 written exam (120 minutes) or 1 oral exam (25-35 minutes) according to examiner’s specifications. After approval by the examination board mathematics (Prüfungsausschuss Mathematik), the examiner can also choose the take-home exam as the form of examination. The exact examination specifications will be announced at the beginning of the course.		
Course achievement	Non-graded coursework (Studienleistung): Homework according to examiner’s specifications. The exact examination specifications will be announced at the beginning of the course.		
Module grade composition			

Contents

The course provides a comprehensive overview of the mathematical foundations of statistical learning theory and its significance for machine learning. It covers fundamental concepts such as hypothesis spaces, learning algorithms, and training and test data. Participants will learn how algorithms are evaluated using loss functions, risk, and Bayes risk, and how expected risk differs from empirical risk.

Key concepts such as risk minimization, regularization, and the bias-variance trade-off are explained to understand the balance between model complexity and overfitting. The analysis of classical learning algorithms, including Support Vector Machines, neural networks, and decision trees, involves examining trade-offs between training error and generalization ability, as well as optimization problems and regularization techniques. The course also introduces advanced topics such as Rademacher complexity and algorithm stability and discusses current research topics and application areas of statistical learning theory in machine learning.

Objective qualification

The students are able to understand the mathematical foundations of statistical learning theory and their practical applications. They have the ability to analyze and evaluate the generalization ability of learning algorithms. The students develop a solid theoretical background for independent research and application in the fields of mathematics and data science.

Recommended requirements			
Expected performance/ Type of examination	Examination: Generation and documentation of computer programs		
Course achievement			
Module grade composition			

Contents

[Distribution and population models(VÜ)]
Approaches to and methods of ecological modelling
Theoretical basics for the generation of ecological models (instructed in the exercises)
Application examples of models in ecology and conservation biology
Approaches to species distribution models in statistics and machine learning (parametric, semi-parametric and nonparametric
techniques) Individual-based (agent-based) modelling
Progamming of species distribution models in R (or comparable software)
Progamming of individual-based population models with NetLogo (or comparable software)

Objective qualification

After successful completion of the module, students have knowledge of the key - statistical and machine learning - methods of species distribution modelling. They also have knowledge of the most important approaches to population dynamic modelling. The students are able to apply both modelling methods for dealing with geoecological and conservation biological questions and they know the advantages and disadvantages of these methods. They are capable to visualise and interpret data and models and to check underlying assumptions as well as to evaluate parameter sensitivities.

Literature

- Franklin J 2010: Mapping Species Distributions - Spatial Inference and Prediction.

- Railsback SF, Grimm V 2011: Agent-based and individual-based modeling: A practical introduction.
Additional literature will be provided online.

Recommended requirements	Lecture "Fundamentals of Fluid Mechanics"		
Expected performance/ Type of examination	1 Examination element: written exam (90 min) or oral exam (30 min to 45 min)		
Course achievement			
Module grade composition			

Contents

- Numerical simulation of fluid flow
- Overview of computational approaches to turbulent flow (RANS, ... , LES, DNS)
- RANS: turbulence modeling
- LES: partly resolved turbulence (filtering, modeling of unresolved scales, boundary and initial conditions requirements on numerical scheme and resolution)
- Hybrid RANS-LES
- Applications of scale-resolving simulations

Objective qualification

Students acquire the concepts and fundamentals of engineering turbulence modeling. Students learn the underlying physics, assumptions and application of various turbulence models. They know the assumptions, governing equations, and the numerical algorithms of each methodology. Students are able to explain and evaluate the results of scale-resolution simulations in a critical way. At the end of the course, students will be able to use concepts from turbulence modeling for the solution of problems within the engineering field.

Class attendance (h)	70	**Self studying (h)**	110
Compulsory requirements			
Recommended requirements			
Expected performance/ Type of examination	Written exam (90 min.)		
Course achievement	Term paper		
Module grade composition			

Contents

- Introduction to coastal engineering (sociological and ecological significance of the coastal zone, tasks and future of the coastal engineer)
- Linear and nonlinear wave theories, including areas of validity and application
- Wave transformation in shallow water (shoaling, refraction, breaking) and in interaction with obstacles (reflection, diffraction)
- Formation mechanisms of the sea state, including procedures for its parameterization and prediction
- Formation and prediction of tides in coastal areas and estuaries, including their special forms, significance and benefits
- Formation and prediction of storm surges and design water levels

Insight into the current state of research in various fields of coastal engineering

Objective qualification

After successful completion of the module, students will have a broad and solid basic knowledge of the mechanics of water waves and hydrodynamic processes in the coastal area, which enables them to determine the load, erosion and transport parameters for the required constructive and functional planning of engineering measures.
The students are able to use the linear and nonlinear theory of water waves to calculate the total wave induced current parameters and the associated effects on sediments, structures and other obstacles. By the mediated calculation basics for wave transformation the students can calculate the effects of the bottom in shallow water (shoaling, refraction, wave breaking) as well as of buildings and other obstacles (reflection, diffraction) on the parameters (height, length, direction) of the waves and their stability (refraction criterion) at the given planning location.
On the basis of the acquired basics of the origin, parameterization, mathematical/statistical description and prediction of the sea state, the students are able to determine the design waves for the functional and constructive planning. They can determine the design water levels on the basis of the acquired knowledge on the formation and prediction of tides on open coasts and in estuaries as well as of storm surges on the German North Sea and Baltic Sea coasts. In the seminar, students are enabled to conduct scientific research and to present research results from current publications in an appropriate manner.

Literature
unter anderem / amongst others: - Detailed Presentation Slides of the Lecture, Exercises, Solutions (PDF) - Teaching Platform with educational videos, interactive diagrams, screencasts and lab videos (coastal.lwi.tu-bs.de) - Task Library of the Institute - EAK (2003): Empfehlungen für Küstenschutzwerke. Remark
In the Seminar in Coastal Engineering on the topic Data Science & Coastal Engineering, an introduction is given to the use of Python as a universal tool for the evaluation and presentation of data; students will implement and evaluate data and methods from the lecture. The successful completion and submission of code implementations will be credited as study achievement (Studienleistung).

Contents

In this module students are introduced to the concepts of deep learning in order to process Remote sensing data. Remote sensing is the science that provides geometric and semantic information about objects at or near the surface of the Earth using the sensors which are installed on satellites or other airborne platforms. Along with fundamentals of remote sensing, some applications like object detection and classification especially on images and also regression algorithms on remote sensing observations will be covered. In the context of image understanding, an introduction to digital image processing will be given, which deals with the application of filters on the images to extract the information which could be used in machine learning and deep learning algorithms. Each of the lectures in this module is supplemented by practical parts to enable the students to process real-world remote sensing datasets, efficiently. After completing the module, students know and understand the most important concepts of deep learning for image analysis. Furthermore, a student is able to implement a selection of algorithms and evaluate the respective result.

Objective qualification

Upon completion of this module, the students will be able to understand basic principles and applications of deep learning and to apply them on Remote Sensing as well as similar problems.

Contents

This Module will introduce the fundamental methods at the core of machine learning, including -but not limited to- classification, regression analysis, clustering, and dimensionality reduction. This course is designed for BSc. and MSc. students in different disciplines who employ machine learning algorithms in their fields. Students will learn about the basic concepts of machine learning and will apply the learned concepts on the practical problems using open source libraries from the Python programming ecosystem. The course will also briefly cover neural networks and will be closed by a short introduction to deep learning. Classes on theoretical aspects will be complemented by practical lab sessions. In this course we do not concentrate on a specific type of data and various datasets will be used in the practical example.

Objective qualification

Upon completion of this module, the students will be able to understand basic principles and applications of machine learning and to apply them on practical examples.

Theory and Experiment, Measurement Uncertainties, Flow visualization methods (smoke, oil flow pictures, laser sheet visualization), pressure measurement, force measurement, hot-wire anemometry, basics of optics, Particle Image Velocimetry (PIV) and its extensions, Schlieren techniques, thermography, pressure sensitive paint, particle measurement techniques

Objective qualification

The students are able to explain mechanical, electrical and optical measurement techniques to determine fluid mechanical quantities like pressure, density, velocity, temperature and shear stress. Beyond the basic principle and the accuracy of the different measurement techniques, the students can evaluate the limitations of the techniques and use methods to improve and expand them. The students are able to apply selected measurement techniques in the laboratory course.

Contents

- Review point-to-point channel capacity and coding theorem
- Strong typical sequences and their properties
- Multiple-Access Channel: Capacity region compared to TDMA/FDMA/SDMA/NOMA
- #Broadcast Channel: degraded BC capacity region, non-degraded BC achievable rate region and converse
- Interference Channel: very strong, strong, weak interference capacity region, medium interference achievable rate region and converse
- #Relay Channel: achievable schemes amplify-and-forward, decode-and-forward, compress-and-forward, estimate-and-forward #Generalization and application of elements to complex networks

Objective qualification

After completing the lecture, the students will know the building blocks of complex communications networks, i.e., the multiple-access channel, the broadcast channel, the relay channel and the interference channel, their achievable rates and capacity regions including coding and decoding schemes. In addition, the students obtain knowledge to design future wireless and multi-hop as well as ad-hoc networks. They master information-theoretic and mathematical tools to prove coding theorems. They know the state of the art as well as open problems in network information theory.

Contents

- Basics of speech production and perception
- Feature extraction
- Hidden Markov models
- Acoustic models and language models
- Automatic speech recognition
- Spoken language systems

Objective qualification

After successful completion of the module, students will be able to classify time series (e.g., speech signals) using hidden Markov modeling. The students acquire all the necessary knowledge to suitably select, design, and evaluate methods and algorithms for automatic speech recognition to solve problems in practice.

Literature

Remark

This module from the master's program is also suitable for bachelor students. Basic knowledge of digital signal processing, as e.g. acquired in the module #digital signal processing#, facilitates the understanding of this lecture.

Using examples from ECG, X-ray imaging, magnetic resonance imaging and optical imaging systems we explain the general methods in medical signal and image processing. The methods are categorized according to their general properties, and the pros and cons of the manifold of methods is discussed using these categories. Systematic evaluation of signal and image analytics with and without ground truth is also addressed in this module.

Objective qualification

Passing this module, the students can classify and compare different methodologies for medical signal and image acquisition. They can differ and compare linear with non-linear filtering and analyze electrocardiography (ECG) data into their components. They can segment medical images in two and three dimensions and are able to apply model-based approaches for image and signal analytics.

Contents

In this module students are introduced to the concepts of deep learning in order to process Remote sensing data. Remote sensing is the science that provides geometric and semantic information about objects at or near the surface of the Earth using the sensors which are installed on satellites or other airborne platforms. Along with fundamentals of remote sensing, some applications like object detection and classification especially on images and also regression algorithms on remote sensing observations will be covered. In the context of image understanding, an introduction to digital image processing will be given, which deals with the application of filters on the images to extract the information which could be used in machine learning and deep learning algorithms. Each of the lectures in this module is supplemented by practical parts to enable the students to process real-world remote sensing datasets, efficiently. After completing the module, students know and understand the most important concepts of deep learning for image analysis. Furthermore, a student is able to implement a selection of algorithms and evaluate the respective result.

Objective qualification

Upon completion of this module, the students will be able to understand basic principles and applications of deep learning and to apply them on Remote Sensing as well as similar problems.

This Module will introduce the fundamental methods at the core of machine learning, including -but not limited to- classification, regression analysis, clustering, and dimensionality reduction. This course is designed for BSc. and MSc. students in different disciplines who employ machine learning algorithms in their fields. Students will learn about the basic concepts of machine learning and will apply the learned concepts on the practical problems using open source libraries from the Python programming ecosystem. The course will also briefly cover neural networks and will be closed by a short introduction to deep learning. Classes on theoretical aspects will be complemented by practical lab sessions. In this course we do not concentrate on a specific type of data and various datasets will be used in the practical example.

Objective qualification

Upon completion of this module, the students will be able to understand basic principles and applications of machine learning and to apply them on practical examples.

Contents

The course consists of hands-on programming tasks that are solved by the participants and subsequently evaluated in a semi-automated way. In total, seven units from the sub-fields (i) basics of hands-on application of machine learning methods, (ii) image processing (computer vision) and (iii) time series analysis have to be completed. The seven units are:

- Interactive introduction to Python fundamentals using Jupyter notebooks, fundamentals of data processing, preparation and visualization.
- Use of single-layer machine learning models to solve a two-class problem: Support vector machines (based on libsvm) and neural networks. Splitting and use of datasets, application of appropriate metrics for evaluation, use of high-level machine learning libraries such as SciKit-Learn
- Use of deep neural networks to solve a multi-class classification problem, introduction to recognized academic datasets such as MNIST and CIFAR-10, introduction to the use of deep learning libraries PyTorch and Tensorflow, usage and adaptation of pre-trained models
- Use of convolutional neural networks to solve more challenging image processing problems such as semantic segmentation and depth estimation, use of regularization methods in training
- Use of diverse cost functions to optimize neural networks, implementation of generative models such as Generative Adversarial Networks (GANs)
- Use of recurrent neural networks to solve problems based on time series data, application of concepts for anomaly detection
- Use of recurrent neural networks for speech processing, e.g., for noise reduction, analysis of neural networks with respect to their complexity (FLOPs, number of parameters)

Six out of the seven units have to be successfully passed for the entire computer lab module to be passed, among these unit 4 (convolutional neural networks) and unit 7 (recurrent neural networks in speech processing).

Objective qualification

In this course, students acquire the competencies to independently select and apply appropriate machine learning and deep learning methods for complex problems. The students ...

- ... master the programming language Python as well as the basics of the deep learning libraries PyTorch and Tensorflow.
- ... evaluate the effectiveness of simple machine learning models and neuronal networks for classification and regression problems.
- ... evaluate the quality of deep learning models on appropriate data (sub)sets with meaningful metrics
- ... know and use different types of neural networks for problems in the areas of image processing, time series processing and generative problems
- ... know and use different strategies for data preprocessing and data augmentation
- ... know and use different training and regularization methods for the optimization of neural networks
- ... evaluate the complexity of a neural network on the basis of various parameters

Compulsory requirements	none		
Recommended requirements	none		
Expected performance/ Type of examination	- term paper - oral presentation		
Course achievement	Successful participation in the practical course and seminar		
Module grade composition			

Contents

The seminar gives an introduction into the metabolism of macrophages and how to analyze it by using isotope-labeling experiments and modeling. Especially the role of itaconic acid, ROS, NO and glutathione is discussed. Afterwards, different analytical methods for studying the Immunometabolism of different cell lines will be presented by the students. The students will plan themselves the workflow for the practical course to answer different biological questions. The students will present their work by using different presentation concepts (talk, poster, etc).
Practical course: Students will apply their theoretical knowledge to answer different biological questions by using the methods discussed in the seminar. The students will apply several methods, covering cell cultivation, metabolite extraction, seahorse measurements, GC-MS measurements and data analysis, metabolic flux analysis with stable isotopes, etc.

Objective qualification

After completing the module, students are able to
- explain the importance of the metabolism of immune cells during infection/inflammation
- apply modern analytical techniques, such as isotope labelling, mass spectrometry and metabolic flux analysis - evaluate and interpret GC-MS data.
- interpret the energy metabolism by means of respiration measurements.
- develop concepts for solving systems biology problems with the help of different methods.
- present and discuss scientific work
- discuss controversial scientific topics and questions

Contents

Lecture Biomolecular Modelling: Introduction to the basics of simulations of biomacromolecules - Born-Oppenheimer approximation, potential energy surface, basics of statistical thermodynamics, empirical force fields and their efficient implementation - geometry optimization, molecular dynamics methods, thermodynamic and static description of (bio)chemical processes, analysis of molecular dynamics simulations, calculation of free energies, multiscale simulation methods - implicit solvent models, coarse-grained models, hybrid QM/MM methods, quantum-chemical embedding methods.

Computer Lab: Use of force field programs, visualization of crystal structures, geometry optimization, molecular dynamics and normal mode analysis of polypeptides, simulation of (bio)molecules) with different computational methods and their analysis, analysis of dynamical and entropic effects.

Project Lab: Molecular Dynamics Simulations of Biomolecules.

Objective qualification

The students are familiar with modern methods for modelling the structure of biomacromolecules and for simulating their thermodynamic properties. The know empirical force field methods, methods for performing molecular dynamics simulations, as well as modern multicale simulation methods. The students are able to judge the applicability and the limitations of such methods, to choose suitable simulation methods for their own research projects and to perform, analyze, and evaluate molecular dynamics simulations.

Contents

- Introduction graph theory
- Biological networks
- Biological network databases
- Statistical network analysis
- Graph algorithms
- Graph-based machine learning

Objective qualification

After successful completion of this module, students will
have a basic understanding of graph theory and its applications for the analysis of biomedical data. They will be able to use network biology tools and critically assess network analyses. They will be capable to devise new graph-based strategies for the analysis of biomedical data.

Contents

Lecture Biophysical Chemistry: Brief review of biochemical and microbiological basics, traditional methods such as fluorescence and absorption spectroscopy, light scattering, Raman spectroscopy, NMR, ESR and mass spectrometry on biomolecules. Modern methods such as fluorescence mi-croscopy, single molecule detection, nonlinear and ultrafast spectroscopy or nanotechnology to study biomolecules. Prospects for industrial applications and drug discovery.

Exercise: Independent calculation and answering of questions with corrections by instructors and assistants, discussion of solution methods in the exercise.

Applied Biophysical Chemisty: In this course, the knowledge gained will be deepened through guest lectures on concrete examples of industrial research, e.g. in combination with an excursion to a pharmaceutical company, or from basic research, e.g. at Max Planck Institutes.

Objective qualification

The students know the basics of the most important physicochemical methods for the elucida-tion of biomolecular interactions and structures and are able to decide which modern or traditional method is most efficient to answer such biochemical questions. They know the limitations and dy-namic range of these methods and the importance of structure and dynamics of biomolecules for their function. Students will be able to classify which methods are suitable for studying biomolecules and answering biomolecular questions in the different environments of industrial or basic research.

Contents

Lecture and Computer Lab Advanced Quantum Chemistry: Mathematical Foundations of quantum-chemical methods, Hartree-Fock theory, perturbati-on theory and configuration interaction, coupled-cluster theory, density-functional theory.

Lecture and Computer Lab Theoretical Spectroscopy: Time-dependent quantum mechanics, interaction of electromagnetic radiation with molecules, basics of Hartree-Fock and density-functional theory, quantum-chemical calculation of spectroscopic data (Infrared and Raman spectroscopy, UV/Vis spectroscopy, ESR and NMR, simulati-on of spectra.

Lecture and Computer Lab Artificial Molecular Intelligence: Molecular quantum mechanics in a nutshell: Hartree–Fock (HF) theory, post-HF methods, density functional theory; Molecular machine learning in a nutshell: molecular representations, deep learning and kernel methods, generative models, uncertainty quantifi-cation, active learning; Applications: structure–property relationships, chemical space exploration, molecular design.

Project Lab Theoretical Biophysical Chemistry: Introduction to scientific programming and in-depth study of selected quantum-chemical methods. Application of quantum-chemical methods that usually cannot be used as "black-box" methods in own independet projects.

Objective qualification

The students have aquired knowledge on modern methods of quantum chemistry. They are familiar with the foundations of important methods and possess an overview of commonly used quantum-chemical methods, their implementation in scientific software, and their use in chemistry. They are able to judge the applicability and the limits of different quantum-chemical methods and to use choose suita-ble methods for their own research projects, to perform quantum-chemical calculations and to analyse, evaluate, and assess their results.

The module focus on several examples, all taken from IT-supported clinical research and medical trials.

Objective qualification

Passing this module, the students develop a fundamental understanding for methodological aspects of medical informatics. They can plan and conduct scientific studies and can develop novel research projects in the field of electronic health. The students can use, compare, and evaluate specific IT tools in medical informatics. They know about data privacy and security issues for medical data in Europe.

Contents

The courses in this module vary from semester to semester. They are announced timely on the web page of PLRI.

Objective qualification

Passing this module, the students have earned a fundamental understanding of the methodological aspects of medical informatics. They can plan and conduct clinical trials and apply appropriate statistics to evaluate the recorded data. They can assess the systematics of scientific research in the broad biomedical field of applied computer science. They can compare IT tools for medical statistics and significance tests.

Contents

- Selected aspects of eHealth and mHealth
- Relevant data formats, standards, and terminologies
- Existing systems in accident and emergency informatics
- Fundamentals to combine medical informatics and technical accident research

Objective qualification

Passing this module, the students can define the goals and perform a technical analysis of traffic accidents. The understand accident and emergency informatics on a more general level, and know the components of this novel field of research. They can use IT systems for accident research and build systems using appropriate data formats, standards, and protocols. Furthermore, they can construct scientific experiments in the field of accident and emergency informatics.

Contents

Using examples from ECG, X-ray imaging, magnetic resonance imaging and optical imaging systems we explain the general methods in medical signal and image processing. The methods are categorized according to their general properties, and the pros and cons of the manifold of methods is discussed using these categories. Systematic evaluation of signal and image analytics with and without ground truth is also addressed in this module.

Objective qualification

Passing this module, the students can classify and compare different methodologies for medical signal and image acquisition. They can differ and compare linear with non-linear filtering and analyze electrocardiography (ECG) data into their components. They can segment medical images in two and three dimensions and are able to apply model-based approaches for image and signal analytics.

Contents

- Healthcare delivery with respect to specific diseases.
- Sensors and data analytics
- Architecture of appropriate information systems
- Evaluation and future perspectives of HET-based healthcare
- Ethical, regulatory and social aspects of HET

Objective qualification

Passing this module, the students are able to name different health enabling technologies (HET) and explain their ethical, regulatory and social aspects. The students can use methods and tools to build HET systems.

Contents

Plan and conduct appropriate experiments including the data analytics using different sensors for unobtrusive assessment of health-determining parameters.

Objective qualification

Passing this module, the students can explain and compare health enabling technologies (HET). This includes knowledge and practical use of HET applications, and its underlying scientific foundation. The students are able to build HET systems using recent technologies and can plan, conduct, and analyze experiments to evaluate HET technologies.

Contents

There is a rapid change in methodology and assessment of current techniques for medical data analytics, in particular using deep learning. Therefore, the content of this module reflects the actual technologies and will be announced shortly before the module starts.

Objective qualification

The students can recall recent trends and technologies to represent and analyze medical data. They are able to compare approaches and report their key characteristics resp. differences. They can construct tools and scientific methodologies for data modelling and analytics. The students recognize quality criterions and can recommend specific approaches.

Expected performance/ Type of examination	Software/program development and report on a data science project.		
Course achievement			
Module grade composition			

Contents

The teaching contents depend on the specific task and are partly taken from the project environment of the lecturer offering the course. They may vary on an annual basis.

Objective qualification

The project thesis can serve as preparation for the master's thesis.
The students are able to use scientific methods systematically to solve a complex task in the area of data science. They are able to plan the work independently and estimate the work time required. They are able to carry out the project controlling and quality assurance e.g. using milestones which they have set for themselves.

Literature

Please ask your supervisor for current literature for your project thesis.

Contents

This course provides students with philosophical knowledge in order to reason thoughtfully, judge effectively and act morally in the field of data science. Students learn to differentiate between concepts, phenomena and actions, which is relevant for understanding the presuppositions and implications of machine ethics. This new field is, on the one hand, concerned with established ethical approaches (Kant, Utilitarianism); on the other hand, with giving machines ethical principles, i.e. programs and operations for discovering a way to resolve ethical dilemmas they might encounter. Whereas enabling machines to function in an ethically responsible manner through their own ethical decision making is a long wished-for in AI and robotics, philosophers and society highlight basic questions still in need for an answer; for example: can machines be moral agents? When adopting norms and values, who should they take as paradigmatic role model? Who has the right to judge about that, and why? Students will learn the preconditions and limits of modeling the world according to machines. Not last, which kind of world machines face by means of artificial sensory perception matters for understanding the difficult questions of embodiment, and really being in the world instead of only having one.

Objective qualification

The course:
- provides a philosophical framework and moral compass for guiding the judgement of students regarding data science and its applications (artificial intelligence, robotics, etc.).
- aims to develop communication skills, social and civic competences,
- reassures students on the limits of machines, machinery settings, and machine ethics,
- strengthens personal development in the light of digit(al)ization and related claims of social change.

The students will be able to recognize and interpret social and technical problems in technology and information processingn based in classical and recent position in theoretical and practical philosophy. They will be able to interpret these problems ethically and support their position with arguments from machine ethics.

Contents

Target is to develop a sensitivity when dealing with data especially if it is person related data. Henceforth the lecture progresses to Data Governance beyond personal data ownership. The students will learn how an organisation can control the use of data by internal regulations and provisions and how intra-organisational data exchange is shaped by standards. The students should develop a broad understanding of the importance of standards and interoperability. Furthermore the students will learn what it takes and what to consider before such a provision/standard is established whether inside an organisation or on intra-organisational level.

Objective qualification

The students understand the differences between the two main legal systems (case law vs. common law) in the EU. They know different sources of legal knowledge.
The students are able to assess company privacy regulations and business models in relation to the legal provisions.

Literature

A list of papers and videos will be provided in the first lecture.
Please see the LMS for further details.

Objective qualification
Superordinate reference/ embedding of the field of study Students will be able to classify their field of study in societal, historical, legal or professionally oriented references (depending on the focus of the course). They are able to recognize, analyze and evaluate higher-level, subject-related connections and their significance. The students acquire an insight into the networking possibilities of the field of study and application references of their field of study in professional life.

Contents

In the first part of the course, topics include structuring the text, appropriate wording, comprehensibility of text, efficient production, review process and ethical aspects.

The second part addresses the creation of "good" visualizations. Students will learn about fundamentals of perception, a proper mapping of
data to visual variables, design principles, and visualization techniques and tools for specific types of data.

The third part covers oral presentations and scientific talks. Using their own research projects as well as other topics in exercises, students will
practice and improve the delivery of their oral presentations.

Objective qualification

Students will learn the principles of scientific writing and gain insights into how to improve their writing.
They will be enabled to properly criticize existing visualizations and create new visualizations that are effective, efficient, and appropriate.They will also learn how to properly structure a talk, how to prepare adequate visual aids (“presentations”), and how oral presentations are different from written text.

Course achievement			
Module grade composition			

Contents

The contents depend on the specific assignment.

Objective qualification

The students are able to work on a problem in the field of data science independently using scientific methods within a given time period.

The following points are particularly important:
- The student can familiarize themselves with the topic of the work independently.
- They can systematically work on a research problem relevant to data science using scientific methods.
- They are able to present the methods and the results in the form of an report.
- They present the main results in an understandable form in a presentation.
- They able to research literature and put their work into context.
